AVG[®] Secure Sign On

Security for the mobile and cloud app world

Business apps are changing the way your employees access data, especially with the growing use of mobile phones, tablets, personal devices, and the cloud. While these apps help drive business, they also bring security risks. AVG Secure Sign On combines industry leading multi-factor authentication (MFA) Identity and Access Management (IAM) and very robust Mobile Device Management (MDM) capabilities, bringing you three integrated layers of security for the price of one.

Key Features

Multifactor Authentication: Multi-factor authentication helps ensure a high level of security required to meet most regulatory compliance features like HIPAA, PCI, FISMA, and GLBA. In addition, Secure Sign On offers SAML certificate based, securely encrypted single sign-on for cloud apps, on premise apps and mobile apps.

Mac OSX and MDM Management: With Secure Sign On we are able to secure and manage your mobile devices and Macs. In addition to creating uniform access across all user devices, we are also able to locate, lock, wipe, deploy mobile and cloud apps as well as perform other operations and audits.

Secure Active Directory: Secure Sign On is integrated with Active Directory to extend user policy password enforcement and app security policy management across all your devices (Win, OSX iOS, Android and Chrome). Single Sign On also handles a mix of company issued and personal (BYOD) devices for secure and uniform onboarding, provisioning and deactivation.
